Data Source: Payment Calculation and Analysis System (PCAS) as at 31 March 2005, taking account of locally resolved adjustments up to 30 June 2005. Raw Prevalence figures are as at 14 February 2005.

<sup>1</sup> The list size is the total number of patients registered with each GP practice at January 2005.

<sup>2</sup> The weighted list size is for information only and is not used in the Quality & Outcomes Framework calculation. It refers to the practice list at January 2005 weighted by the GMS Allocation Formula indices (see QOF Links page for further details).

<sup>3</sup> For each practice the raw prevalence per 1,000 is the number of patients on each disease register, divided by each practice's list size, multiplied by 1000. This is not reported where the figure is based on fewer than 5 patients.

<sup>4</sup> Adjusted Disease Prevalence Factor (ADPF) narrows the range of adjusted raw prevalence per 1,000 values by square root transforming each value and then rebases that figure around the NI adjusted raw prevalence value.

<sup>5</sup> Practice 438 actually refers to 3 separate practices - 436, 437 and 438 who have a shared server, thus the data for each practice cannot be separated.

Data Source: Payment Calculation and Analysis System (PCAS) as at 31 March 2005, taking account of locally resolved adjustments up to 30 June 2005. Raw Prevalence figures are as at 14 February 2005.

<sup>1</sup> The list size is the total number of patients registered with each GP practice at January 2005.

<sup>2</sup> The weighted list is for information only and is not used in the Quality & Outcomes Framework calculation. It refers to the practice list at January 2005 weighted by the GMS Allocation Formula indices (see QOF Links page for further details).

<sup>3</sup> For each practice the raw prevalence per 1,000 is the number of patients on each disease register, divided by each practice's list size, multiplied by 1000. This is not reported where the figure is based on fewer than 5 patients.

<sup>4</sup> Adjusted Disease Prevalence Factor (ADPF) narrows the range of adjusted raw prevalence per 1,000 values by square root transforming each value and then rebases that figure around the NI adjusted raw prevalence value.
